

React Developer Assessment

Build a simple React app that uses an auto-complete search input to display the selected user's name and address in the page using TypeScript.

Requirements:

- Use of the [Fetch API](#)
- Use the Material UI [Autocomplete component](#)
- Any React framework or packages you see fit to use

Task Details:

As a user I would like to have an auto-complete search input that is populated from the JSON Placeholder API's [Users endpoint](#) to look up individuals so that I can retrieve their address. The auto-complete suggestions should be listed alphabetically based on the last name in this format, **{Last Name} {Suffix}, {First Name} (Title)**. Only show the suffix and/or title if it is contained in the data set. No need to extrapolate them.

For example,

- "Jane Doe" => "Doe, Jane"
- "Mr. John Doe Jr." => "Doe Jr., John (Mr.)"
- "Mr. James Von Doe III" => "Von Doe III, James (Mr.)"
